Have You Tested Your Well This Year?

1 in 6 Rock County wells tested for bacteria are unsafe

1 in 3 Rock County wells tested for nitrates are unsafe

**Preventing Illness and
Enhancing Health by**

What Should You Test For?

The Public Health Department recommends testing for coliform bacteria and nitrates annually. You should also test your well any time you notice a change in taste or odor in your water.

Health Effects of Contaminated Water

- ◆ Bacteria can cause flu-like symptoms such as nausea, vomiting, fever, and diarrhea
- ◆ High nitrate levels can cause “blue baby syndrome”, an oxygen deficiency in the blood
- ◆ Insects such as earwigs can carry bacteria, viruses and pesticides into your well

How to Test Your Well

Test kits are available at our North Office in Janesville and our South Office in Beloit. Directions are located on the back of this pamphlet.

Bacteria & Nitrate tests costs **\$25.00** each
(Prices subject to change)

Steps You Can Take To Protect Your Drinking Water Supply

Install a vermin proof well cap. This will keep out bacteria laden insects; our most common problem.

Locate pollution sources, such as storage tanks, septic systems, feed lots, etc., away from your well.

If you have a well pit, consider abandoning it and installing a pitless adapter.

If you are constructing a new well, extend your casing as deep into the aquifer as practical to avoid potential contaminants.
